****Nationwide Recall of “biQ-FEL” Supplements After Discovery of Hidden Viagra-Like Drugs**** A&P Creations LLC has pulled its popular “biQ-FEL” sexual-enhancement supplement from shelves across the United States after testing revealed undeclared amounts of sildenafil and tadalafil, the active ingredients in prescription drugs Viagra and Cialis.

By Public Health Research Desk Published September 18, 2026

The Food and Drug Administration (FDA) issued an urgent safety alert on Monday, September 14, after laboratory analysis confirmed that several batches of biQ-FEL contained sildenafil and tadalafil—both prescription-only medications used to treat erectile dysfunction. The ingredients were not listed on the product label, violating federal law that requires all active pharmaceutical components to be disclosed.

The recall affects an estimated 1.2 million bottles of biQ-FEL sold under the brand names “X10 Natural Enhancement” and “biQ-FEL” through major retailers including Amazon, Walmart.com, and dozens of brick-and-mortar stores. A&P Creations LLC, the manufacturer, announced a voluntary nationwide recall and urged consumers to stop using the product immediately, return unopened packages for a full refund, and contact the company’s hotline for guidance.

Why the story matters now is twofold. First, the presence of prescription-only drugs in over-the-counter supplements raises serious safety concerns for millions of Americans who may be unaware they are ingesting potent vasodilators that can interact with other medications, especially nitrates used for heart disease. Second, the incident highlights ongoing challenges in regulating a booming dietary-supplement market that, according to the FDA, generates more than \$50 billion in annual sales and is only loosely overseen compared with prescription medicines.

Sildenafil and tadalafil belong to a class of drugs called phosphodiesterase-5 (PDE-5) inhibitors. They work by relaxing smooth muscle in the blood vessels of the penis, allowing increased blood flow that facilitates an erection. While effective when prescribed and monitored, these agents can cause side effects such as headache, flushing, low blood pressure, and, in rare cases, vision loss. The risk escalates when taken by individuals with cardiovascular disease, uncontrolled hypertension, or those on nitrate medications, because the combined effect can lead to dangerously low blood pressure.

The CDC’s recent advisory notes that “undeclared ingredients” in supplements pose a public-health threat, especially when the hidden substances are prescription-only drugs. The agency stresses that “FDA approval of Viagra and Cialis is restricted to use under the supervision of a licensed health-care professional.” Without a

doctor's oversight, consumers cannot be screened for contraindications, nor can they receive proper dosing instructions.

A&P Creations LLC confirmed that the affected lots were produced between March and July of this year at its Springfield, Illinois facility. The company says the contamination was "unintentional" and resulted from a "cross-contamination event" during a shared manufacturing line that also processes prescription erectile dysfunction medications for a third-party client. The firm has halted production at the plant, instituted a comprehensive cleaning protocol, and is cooperating with the FDA's investigation.

The recall follows a pattern of similar incidents in recent years. In 2023, the FDA warned about "X10 Natural Enhancement" after discovering hidden sildenafil in a different batch, prompting a limited recall that was later expanded. Earlier this month, the agency issued a warning about another supplement, "VigorMax," which also contained undeclared tadalafil. These cases have spurred calls from consumer advocacy groups for stricter oversight of the supplement industry, including mandatory pre-market testing and clearer labeling requirements.

Public health experts caution that the true scope of exposure may be larger than the recalled inventory suggests. "Many consumers purchase supplements online, and shipments can bypass traditional retail checks," said Dr. Lena Morales, an epidemiologist at the University of Michigan. "If a product is mislabeled, the risk isn't just to the individual buyer but also to anyone sharing the supplement with family members, including children."

The FDA's Center for Food Safety and Applied Nutrition (CFSAN) has opened a formal investigation into A&P Creations' manufacturing practices. Under the Food, Drug, and Cosmetic Act, the agency can issue warning letters, impose fines, or pursue criminal action if it determines that the company knowingly concealed the presence of prescription drugs. So far, no criminal charges have been filed, but the agency's "Recall Enforcement Report" indicates that 78 percent of recalls involving hidden pharmaceuticals result in additional enforcement actions within six months.

Consumers who have purchased biQ-FEL are advised to check the lot numbers listed on the recall notice—available on the FDA's website and the company's official page—and to retain receipts for refund processing. The hotline, staffed by trained pharmacists, can answer questions about potential health effects and advise whether a medical evaluation is warranted.

Healthcare providers are also being alerted to the recall. The American Urological Association (AUA) has circulated a bulletin urging physicians to ask patients about recent supplement use, especially if they present with unexplained hypotension, visual disturbances, or chest pain. "Patients often assume that 'natural' means safe," said Dr. Raj Patel, a urologist in Chicago. "When a supplement contains a PDE5 inhibitor without a prescription, we lose the safety net that comes with a doctor's assessment."

The incident arrives at a time when the United States is grappling with broader medication safety challenges. A 2025 global burden-of-disease analysis projected that cardiovascular and metabolic syndromes—conditions that can be exacerbated by inappropriate use of vasodilators—will affect nearly 30 percent of adults by 2050. Undeclared sildenafil and tadalafil could inadvertently contribute to that trend by precipitating cardiovascular events in vulnerable populations.

Meanwhile, the recall underscores the importance of robust post-market surveillance. The CDC's Food Safety Surveillance System, which tracks adverse events linked to dietary supplements, logged 1,842 reports of side effects potentially related to hidden PDE5 inhibitors in the past year, a 27 percent increase from 2023. While not all reports can be definitively linked to a specific product, the upward trajectory signals a growing public health

concern.

Industry analysts note that the financial impact on A&P Creations could be significant. The company, which reported \$120 million in revenue last fiscal year, now faces potential lawsuits from consumers and investors, as well as the cost of recalling millions of units. “The reputational damage may be more lasting than the immediate monetary loss,” said Karen Liu, a market research analyst at HealthTech Insights. “Brands that fail to ensure product integrity risk losing consumer trust across their entire portfolio.”

Legislators in several states have already introduced bills aimed at tightening supplement regulation. A bipartisan proposal in the U.S. Senate would require manufacturers to submit a safety dossier to the FDA before marketing any product containing active pharmaceutical ingredients, even if the dosage is low. Proponents argue that such measures could prevent future incidents like the biQFEL recall, while opponents warn of increased costs and reduced consumer choice.

For now, the priority remains public safety. The FDA’s recall notice emphasizes that anyone who experiences symptoms such as dizziness, fainting, rapid heartbeat, or visual changes after taking biQFEL should seek immediate medical attention. Health care professionals are urged to document any adverse events and report them through the FDA’s MedWatch system, which helps track product-related injuries and illnesses.

The biQFEL case serves as a reminder that “natural” labels do not guarantee the absence of potent drugs. As the supplement market continues to expand, consumers, clinicians, and regulators may remain vigilant to ensure that products sold over the counter meet the same safety standards as prescription medicines.
