Selective Femoral Resurfacing for Bilateral Knee Osteonecrosis: A Bone-Preserving Alternative to Total Knee Arthroplasty. What recent evidence from trusted sources suggests, and what remains uncertain. Reliability: Low. By Public Health Research Desk Updated April 10, 2026 What happened A high-signal health update was detected from PubMed. Our system reviewed the original report and compared it against independent references from recognized public health and research institutions. What the evidence says This review found 1 peer-reviewed study references, 0 trusted news references, and 0 preprint references from recognized domains. The evidence points to potentially meaningful relevance, but interpretation should consider study design, population differences, and reporting limitations. What this means for the public For general audiences, this update is best understood as evidence to monitor rather than a standalone directive. Individuals should avoid making medication or treatment changes without consulting qualified clinicians. What remains uncertain Not all studies have equal strength, and some findings may change as additional data is published. Where evidence is early or limited, conclusions should remain cautious.
